SUMMARY

Systems-minded software engineer and B.E. Computer Science candidate (2027, CGPA 8.51, no backlogs) who designs backend services around correctness under concurrency, real-time event delivery, and reproducible data layers. Builds on Node.js, PostgreSQL, Prisma, and Socket.IO — modelling workflows as state machines, enforcing consistency with atomic transactions, and versioning schemas through migrations. Grounded in DSA (250+ problems in Java), OS, DBMS, and Computer Networks.

TECHNICAL SKILLS

- **Languages:** Java, C++, Python, JavaScript, SQL
- **Backend Systems:** Node.js, Express.js, RESTful service design, Socket.IO (WebSocket event streaming), Prisma ORM
- **Data Layer:** PostgreSQL, MySQL, MongoDB — relational schema design, ACID transactions, versioned migrations (node-pg-migrate)
- **Systems Concepts:** Concurrency and race conditions, state machines, data consistency, process scheduling, networking fundamentals
- **Cloud & DevOps:** AWS (EC2, S3, RDS), Docker, Git/GitHub, CI/CD fundamentals
- **Frontend:** React, Tailwind CSS
- **Practices & Tools:** Agile, code review, debugging, testing, technical documentation; GitHub Copilot, Cursor, Claude, ChatGPT, Google Antigravity

PROJECTS

Noush — Event-Driven E-Commerce Backend | Node.js, Express.js, PostgreSQL, Prisma, Socket.IO, React

- Modelled the order lifecycle as a server-enforced **finite state machine** (pending → confirmed → shipped → delivered), rejecting invalid transitions and streaming each state change to clients over **Socket.IO**.
- Solved the **concurrent-checkout race condition** by executing stock decrement and order creation inside a single **atomic Prisma transaction**, so both commit or both roll back — no overselling.
- Translated the founder's operational workflows into success metrics and system requirements for a merchandising and restock-analytics module.
- Leading the re-architecture from a single-vendor MVP to a **multi-vendor marketplace**, defining the tenant data model and service boundaries before writing code.

Nexfolio — Stock Trading Simulation Platform | Node.js, Express.js, PostgreSQL (pg), React, Tailwind CSS

- Building a Zerodha-inspired paper-trading system (virtual funds) as a three-tier architecture: React client, Express **REST API layer**, and **PostgreSQL** persistence via node-postgres.
- Treating the database schema as code with **node-pg-migrate versioned migrations**, giving deterministic, reproducible, and reviewable schema state across environments.
- Delivering a responsive dark-themed trading dashboard with separate mobile and desktop layouts.
- Shipping through feature branches and squash-merged PRs, with AI-generated code (Google Antigravity, Claude) passed through a mandatory human-review gate.

Resume Builder | React, Node.js, MongoDB | Team project (2 developers)

- Built a resume management service exposing **CRUD REST endpoints** over a **MongoDB** document store, with a React client.
- Split frontend and backend ownership with a teammate and used PR reviews to lock down **API contracts** and catch integration defects early.

EDUCATION

B.E. Computer Science & Engineering — Chitkara University	2023 – 2027	CGPA 8.51
Class XII — Delhi Board	2022 – 2023	72%
Class X — Delhi Board	2020 – 2021	89%

ACHIEVEMENTS

- Solved 250+ Data Structures & Algorithms problems in Java across LeetCode and the Striver A2Z DSA Sheet.
- Caught and fixed a functional bug and a **security vulnerability** in AI-generated code during pre-merge review of a full-stack project.
